

Notice Regarding Fuel Cell

It has come to our attention that a number of plates used in assembling a limited number of Fuel Cells were cut with a special cutting oil and were not properly cleaned before assembly. This does not cause any harm, it just means the fuel cell may get gunked up faster than usual and may not be effective until it has been burned in or properly cleaned. This is due to the residue of oils used to stamp out the plates.

This was only with a very limited number of plates, but we want to alert you, just to be sure. To ensure that you will not have a problem, it is best to clean the fuel cell before installing as follows:

Fuel Cell Flushing

Place the fuel cell in a clean bucket of mineral spirits filled to the height of the fuel cell. (Note: mineral spirits may be purchased at Home Depot).

Place the syringe hose on the upper outlet.

Wearing protective eyewear and gloves, gently suck back and forth with the syringe, drawing the mineral spirits in and out of the fuel cell.

Allow fuel cell to set for several minutes with mineral spirits inside of it and then repeat previous step.

Now repeat all previous steps using water instead of the mineral spirits.
